## setting the core dump name schema

Why would you want to change the names of the coredump from the default?

Update: this is also a very useful defence against a currently known severe security affecting bug. See Core Dump Handling Vulnerability for information and workarounds

Lets assume you got a couple of core dumps files in one directory (e.g. home) and you don't know which program caused it.

Unless you have a grsec/pax kernel with logging features enabled, it might get tricky to find out who caused the coredumps.

This is the point where the naming scheme comes handy:)

The pattern can be read/set via /proc/sys/kernel/core\_pattern.

To set a new one just do:

```
echo "newpattern" > /proc/sys/kernel/core_pattern
```

you can have variables to make the file named different per executable, pid a.s.o.. max length 64 characters; default value is "core"

Here is a small list of possible variables

```
%p: pid
%>NUL>: '%' is dropped
%%: output one '%'
%u: uid
%g: gid
%s: signal number
%t: UNIX time of dump
%h: hostname
%e: executable filename
%>OTHER>: both are dropped
```

If core\_pattern does not include "%p" (default does not) and core\_uses\_pid is set, then .PID will be appended to the filename.

```
example:
```

```
echo "core.%e.%p" > /proc/sys/kernel/core_pattern
```

produces files names

core.>executable>.>pid>

to make the changes permanent, add the following line to /etc/sysctl.conf:

```
kernel.core_pattern = core.%e.%p
```

happy core dumping.
